

Product Features

- GaN on SiC HEMT
- In/Out Impedance Matching
- Surface Mount Hybrid Type
- Small Size & Mass
- High Efficiency
- Low Cost
- Custom design available

Applications

- Radio System

Package Type : NP-1E

Description

The HM0005-10A is designed for Radio system application frequencies from 20 ~ 520MHz.

This amplifier uses GaN HEMT technology which performs high breakdown voltage, high efficiency. High In/Output impedance, high power density.

Electrical Specifications @ Vds =28V, Ta=25℃

PARAMETER	UNIT	MIN	TYP	MAX	CONDITION
Frequency Range	MHz	20	-	520	ZS = ZL = 50 ohm
Power Gain	dB	-	30	-	Amp : Idq1 = 50mA Idq2 = 250mA Input Power = 10dBm
Gain Flatness		-	±1	-	
Input Return Loss		-	-	-8	
Pout @ Psat	dBm	39	40	-	Gate Bias (Vgs1 and Vgs2)
PAE	%	30	45	-	
Ids	mA	-	-	1100	
Supply Voltage	V	-3.5	-3	-2	Main Bias(Vds)
	V	-	28	-	

Caution

The drain voltage must be supplied to the device after the gate voltage is supplied

Turn on : Turn on the Gate Voltage supply and last turn On the Drain voltage supplies

Turn off : Turn off the Drain Voltage and last turn off the Gate voltage

Note

HM Series have internal DC blocking capacitors at the RF input and output ports

* Mounting Configuration Notes

1. For the proper performance of the device, Ground / Thermal via holes must be designed to remove heat.
2. To properly use heatsink, ensure the ground/thermal via hole region to contact the heatsink. We recommend the mounting screws be added near the heatsink to mount the board
3. In designing the necessary RF trace, width will depend upon the PCB material and construction.
4. Use 1 oz. Copper minimum thickness for the heatsink.
5. Do not put solder mask on the backside of the PCB in the region where the board contacts the heatsink
6. We recommend adding as much copper as possible to inner and outer layers near the part to ensure optimal thermal performance.

Precautions

This product is a Gallium Nitride Transistor.

The Gallium Nitride Transistor requires a Negative Voltage Bias which operates alongside a Positive Voltage Bias. These Biases are applied in accordance to the Sequence during Turn-On and Turn-Off.

The Pallet Amplifier does not have a built-in Bias Sequence Circuit. Therefore, users need to either apply positive voltages and negative voltages in the required sequence, or add an external Bias Circuit to this Amplifier.

The required sequence for power supply is as follows.

During Turn-On

1. Connect GND.
2. Apply Vgs1 and Vgs2.
3. Apply Vds.
4. Apply the RF Power.

During Turn-Off

1. Turn off RF power.
2. Turn off Vds, and then, turn off the Vgs1 and Vgs2.
3. Remove all connections.
